# Charting the Year Ahead: Investment Ideas for 2026

Marc Seidner, CIO of Non-traditional Strategies, explores opportunities across equities, bonds, credit, and commodities that have the potential to offer investors resilience and diversification.

A company of **Allianz**

# Introduction

After a year of broad-based gains, many investors feel both upbeat and uncertain looking toward 2026.

Equities extended their bull run in 2025, but valuations remain historically stretched amid a sharp dispersion of returns across sectors. Cash offered both safety and income for a while, but it no longer seems attractive as the Federal Reserve cuts interest rates.

And the U.S. economy appears resilient, yet a K-shaped split shows prosperity for wealthier households diverging from mounting strain for others.

We'll update our views on the economy and fixed income markets in more detail in our January *Cyclical Outlook*. For now, we'll explore select areas of interest across financial markets looking toward 2026 – individual themes that can be brought together in a portfolio – in a way that's actionable for investors and advisors.

## I. Equities: Expensive on the surface, value beneath

U.S. equities approach 2026 with valuations still near historical highs after a multi-year, technology-driven rally. While AI investment continues to underpin economic growth and market optimism, the concentration of returns in a handful of mega-cap tech stocks raises questions about sustainability.

The tech sector, once celebrated for capital efficiency, has entered a more capital-intensive phase. AI-related spending, previously funded largely by free cash flow, is increasingly fueled by debt issuance. Another notable spending trend: The biggest hyperscalers and chipmakers are funneling billions of their investment dollars into one another through circular deals that amplify sector-specific risks.

Beneath the surface, however, the story is more nuanced. For example, value-oriented stocks remain attractively priced relative to historical averages (see Figure 1), suggesting potential for mean reversion over time.

**Figure 1: Value stocks may have more room to run**

Source: Compustat, Capital IQ, MSCI, PIMCO calculations as of 21 November 2025. Normalized value spread using PIMCO Value Composite, Developed Markets.

Macro conditions could provide a tailwind for value in the near term. An outlook for trend-like U.S. economic growth should help broaden earnings growth across sectors in 2026. In our view, the best scenario for value is if the Fed continues cutting rates into reaccelerating and broadening growth.

We also see opportunities to diversify globally. Central banks in emerging markets (EM), having established stronger monetary policy frameworks, now have more flexibility to ease policy and stimulate domestic demand, potentially supporting EM equities. Specifically, we see attractive opportunities in Korea and Taiwan, which offer exposure to the tech sector at cheaper valuations, and China.

## II. Cash is not a strategy: The case for fixed income

In our view, investors who continue holding excess cash today are missing a potential opportunity.

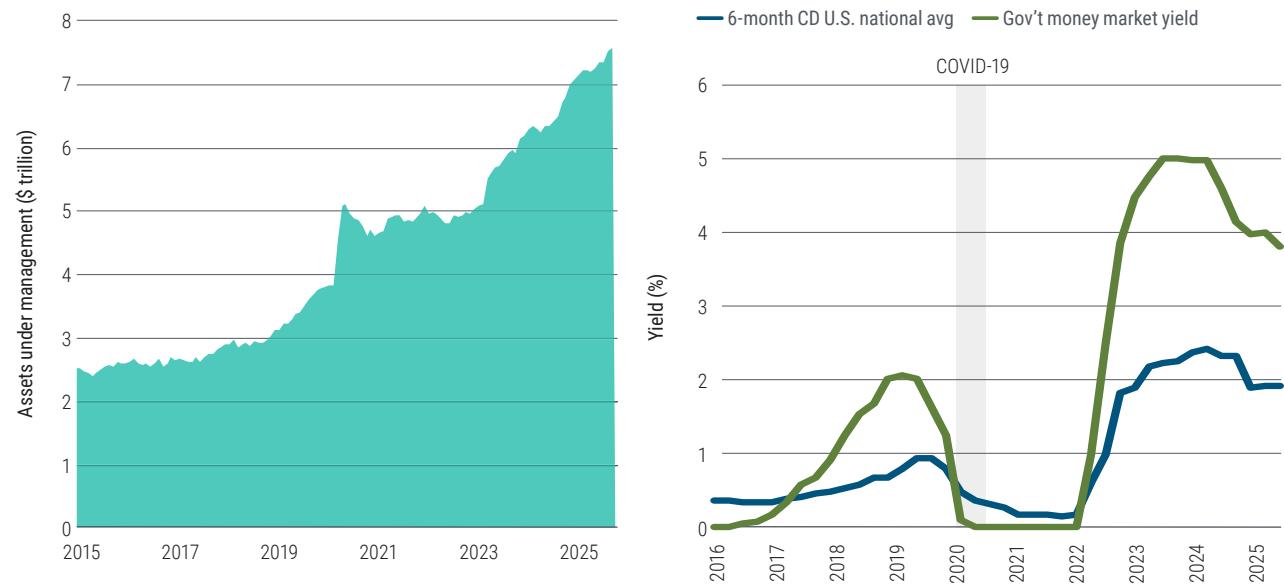

Unusually high returns attracted investors to cash during the post-pandemic period of elevated inflation and Fed interest rate hikes (see Figure 2). But the current Fed rate-cutting phase brings opportunity costs and reinvestment risk, as cash holdings are repeatedly rolled into lower-yielding instruments.

As yield curves have steepened, cash yields have declined relative to a variety of bond maturities. Bonds allow investors the potential to lock in income at more favorable levels over longer horizons.

When interest rates fall, cash earns less, but bonds typically gain in value, enhancing total return potential. At today's yields, high quality bonds look attractive across many possible economic scenarios. With inflation having moved back toward central bank targets, bonds again provide opportunities for diversification through their traditional negative correlation to stocks, helping portfolios weather equity downturns.

**Investor takeaway:** With high valuations concentrated among a small number of companies, it's not difficult to find attractively valued stocks with desirable characteristics such as robust balance sheets and healthy growth. Consider tilting toward undervalued sectors rather than chasing the most expensive parts of the market.

Figure 2: Money market fund assets have kept climbing even as cash rates have declined

Source: Money market fund assets under management (AUM) according to Crane Data as of 31 October 2025. Average 6-month CD and government money market yield data according to Bloomberg as of 30 September 2025.

Investors can also take advantage of today's abundance of global fixed income opportunities, with attractive real and nominal yields available in countries across developed and emerging markets, such as the U.K., Australia, Peru, and South Africa (for more, see PIMCO's October 2025 *Cyclical Outlook*, "Tariffs, Technology, and Transition"). We believe diversification across regions and currencies is an effective way to harvest differentiated sources of return while fortifying portfolios.

### III. All that glitters: Gold, crypto, and the search for real assets

Gold's extraordinary rally – recently topping \$4,300/oz – has captured widespread attention. Prices have soared to all-time highs even in a generally risk-on market environment. Investor demand for inflation protection, geopolitical hedging, and diversification away from the U.S. dollar has reinforced gold's role as a strategic asset. Central banks now hold more gold than U.S. Treasuries (see Figure 3), reflecting a shift in reserve management.

The geopolitical backdrop remains a key driver. The 2022 seizure of Russian reserves helped catalyze gold accumulation as a politically neutral store of value. This trend, coupled with persistent trade frictions and rising sovereign debt, suggests structural support for gold demand. A potential gold price increase of more than 10% over the next year is feasible, in our view.

However, gold's recent rally has been fueled by momentum and liquidity as much as by fundamentals, and short-term retracements are possible. While falling interest rates reduce the opportunity cost of holding gold, its valuation appears elevated relative to real yields, warranting careful sizing within portfolios.

Since 2020, commodity indices have delivered returns comparable to global equities but with lower volatility,<sup>1</sup> reinforcing their role as diversifiers and inflation hedges. Historical evidence shows that even modest allocations to commodities can improve portfolio efficiency,

**Investor takeaway:** Consider rotating from cash into high quality bonds for the potential to lock in yields and position for capital appreciation as interest rates decline. We favor 2- to 5-year bond maturities.

Source: Bloomberg, International Monetary Fund, and Federal Reserve Economic Data (FRED) as of 30 September 2025

particularly when inflation runs slightly above central bank targets.

Broad commodities can also provide a potential alternative way to play the AI investment theme, as infrastructure needs drive demand for inputs such as copper, lithium, and energy as well as strategic assets like rare earths.

Crypto assets, led by bitcoin, continue to evolve as digital analogs to gold, appealing to younger investors and those concerned about currency debasement. The

recent decline in bitcoin reminds investors that it is a volatile instrument and perhaps not a true store of value. The rise of stablecoins and tokenized assets points to a transformative year ahead for digital finance, though volatility, tax treatment, and regulatory uncertainty remain significant considerations.

**Investor takeaway:** Consider modest, diversified allocations across gold and broad commodities for the potential to enhance portfolio resilience and inflation protection without overconcentrating in any single theme.

## IV. Credit markets: Risks and rewards along the credit continuum

Credit spreads remain tight. PIMCO has cautioned throughout 2025 about risks in certain lower-rated credit sectors, particularly within private market areas that have experienced sharp growth. We are now seeing some of those challenges surface, including recent bankruptcies and instances of fraud, which may be symptomatic of broader late-cycle laxity in credit underwriting.

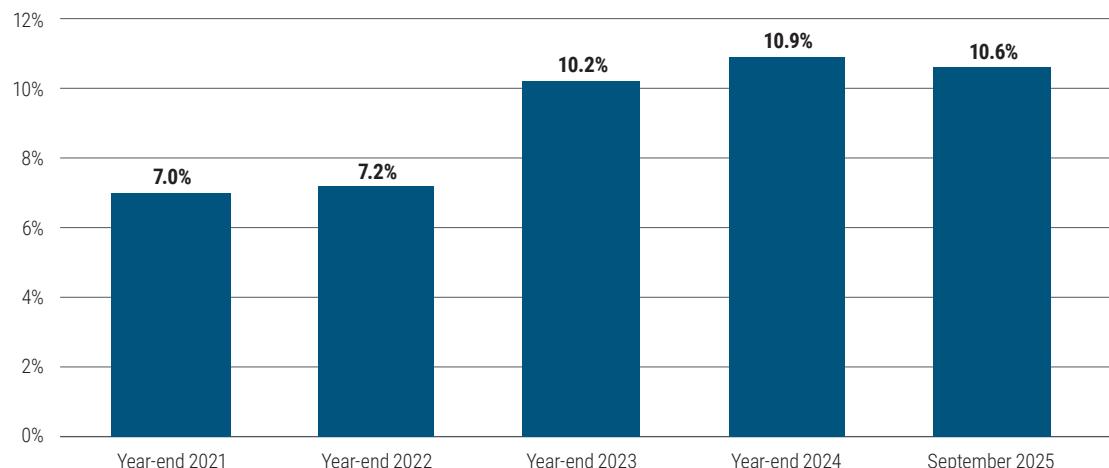

Challenges are showing up in other ways. On average, shares of publicly traded business development companies (BDCs), investment vehicles for corporate direct lending, are trading at roughly a 10% discount to their net asset values. This suggests that the market is cautious about a combination of declining dividends (due to falling short interest rates) and rising credit problems. Indeed, against a strong equity market backdrop, we have also seen share price declines this year for major alternatives firms.

While debt service may become easier with lower interest rates, we have observed more privately financed companies seeking amendments to their loans or paying their debt with additional debt – known as payment-in-kind (PIK) financing – both of which can be signs of debt-servicing challenges (see Figure 4). In fact, using PIK and other data, Lincoln International calculates a “shadow default rate” of 6% as of August 2025, up from 2% in 2021.

Amid these strains in certain areas, PIMCO sees ongoing opportunities in credit markets for investors who can look beyond whether an investment is public or private (for more, see our latest *View From the Investment Committee* video, “[Starting Valuations Fuel 2025 Bond Performance, 2026 Potential](#)”). In our view, the key is to focus on evaluating liquidity and credit risk across both areas and finding where the potential rewards are greatest.

**Figure 4: Payment-in-kind (PIK) trends can signal debt-servicing challenges**

Percentage of private market investments with PIK interest present

Source: Lincoln International as of 30 September 2025

We are seeing opportunities in certain large-scale financings, where competition is limited; in credit linked to lower-risk consumers; and in select real estate lending. Longer-term trends – such as the buildup of home equity among more affluent borrowers, and the expansion of AI and related energy needs – create potential opportunities to provide high quality financing with returns that can rival or exceed those of lower-quality, leveraged corporate credit.

For example, while we have a cautious outlook in general for data centers and AI, many hyperscalers are strong, investment grade companies that need to invest – and borrow – to build out AI infrastructure. We have seen compelling opportunities in recent months in project finance, or lending secured by data centers that are being built with leases in place to investment grade tenants. Such financings do not necessarily reflect a sector-level call but rather represent opportunities with high barriers to entry, which can result in attractive valuations, structures, and tenants.

**Investor takeaway:** 2026 will likely shed light on whether recent challenges are indicative of broader underwriting problems in lower-rated credit. In the meantime, we would suggest investors think carefully about the positions they hold and whether they are being compensated for their potential credit risk, illiquidity, declining yields, and lack of transparency. The credit continuum offers many opportunities to finely tune exposure to each of these risks, and investors should use the full toolkit. At a time when many direct-lending approaches resemble passive “buy the market” strategies, we believe investors should consider being active in their credit allocations. Consider flexible strategies that are agnostic between public and private in their pursuit of superior risk- and liquidity-adjusted returns.

## V. Municipal bonds: Attractive yields and strong fundamentals

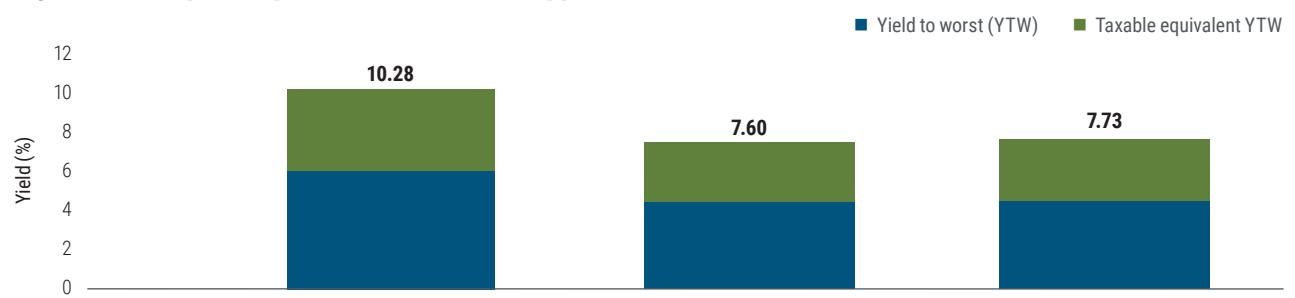

Municipal bonds offer high absolute yields, attractive relative value, and strong credit fundamentals, supported by robust balance sheets strengthened through record tax collections and pandemic-era federal aid. PIMCO’s capital market assumptions expect investment grade and high yield municipals to deliver some of the strongest risk-adjusted returns among public market asset classes over the next five years on a tax- and default-adjusted basis.

While the overall muni market looks healthy, risks persist in certain segments. Many lower-quality high yield deals issued from 2016 through 2021 – particularly in project finance – are highly leveraged and feature weak covenants. These structures could face elevated default rates and low recovery prospects. Despite these risks, spreads remain tight, underscoring the importance of discipline in credit selection and sizing.

Opportunities are emerging in non-traditional areas as financial institutions retreat from tax-exempt holdings. PIMCO sees value in private placement municipals that are not rated but are backed by high quality assets.

When structured appropriately, these securities often carry investment grade characteristics while offering yields comparable to high yield bonds (see Figure 5).

**Figure 5: Select private placement bonds offer opportunities**

	Private placement bond	Public market BBB security	Public market liquid high yield risk
<b>Coupon</b>	6.26	4.38	4.00
<b>Private placement</b>	Yes	No	No
<b>Duration</b>	8.03	8.35	8.26
<b>Credit quality</b>	None	BBB	None
<b>YTW</b>	6.08	4.50	4.57

Source: Bloomberg, PIMCO as of 30 September 2025. The tax-equivalent yield is determined using the top federal marginal tax rate of 37%, in addition to a Medicare tax of 3.8% for top earners. Together these top tax rates cumulate to a top tax rate of 40.8%, which is the rate used to determine the taxable-equivalent yield. PIMCO does not provide legal or tax advice. Please consult your tax and/or legal counsel for specific tax or legal questions and concerns.

This dynamic allows portfolio managers to build resilient portfolios without taking on excessive credit risk, leveraging PIMCO's integrated approach across public and private markets. Looking ahead, municipal bonds remain a strategic allocation for U.S. taxpayers seeking tax-efficient income and diversification.

**Investor takeaway:** Munis offer some of the most attractive tax-adjusted return potential for 2026, but selectivity matters. Focus on high quality issuers and innovative structures while avoiding the weakest high yield segments.

## Conclusion

Across asset classes, a common thread is the need for active decision-making in 2026. Dispersion in equity returns, shifting interest rate dynamics, and the evolving interplay of public and private credit markets underscore the importance of independent investment research and risk management. Rather than chasing crowded trades or relying on static allocations, investors should consider strategies that balance liquidity, return potential, and diversification, while remaining flexible enough to seize new opportunities as they emerge.

Ultimately, 2026 may reward investors who embrace today's macroeconomic environment: leaning into high quality fixed income as rates decline, selectively adding real assets for resilience amid geopolitical and inflation risks, and identifying undervalued equity sectors amid a concentrated market. In a world where uncertainty persists alongside optimism, thoughtful portfolio construction will be key.

**Past performance is not a guarantee or a reliable indicator of future results.**

All investments contain risk and may lose value. Investing in the **bond market** is subject to risks, including market, interest rate, issuer, credit, inflation risk, and liquidity risk. The value of most bonds and bond strategies are impacted by changes in interest rates. Bonds and bond strategies with longer durations tend to be more sensitive and volatile than those with shorter durations; bond prices generally fall as interest rates rise, and low interest rate environments increase this risk. Reductions in bond counterparty capacity may contribute to decreased market liquidity and increased price volatility. Bond investments may be worth more or less than the original cost when redeemed. Income from **municipal bonds** is exempt from federal income tax and may be subject to state and local taxes and at times the alternative minimum tax. Private credit involves an investment in non-publicly traded securities which may be subject to illiquidity risk. Portfolios that invest in private credit may be leveraged and may engage in speculative investment practices that increase the risk of investment loss. **Equities** may decline in value due to both real and perceived general market, economic and industry conditions. **Diversification** does not ensure against loss. **Commodities** contain heightened risk, including market, political, regulatory and natural conditions, and may not be appropriate for all investors. The value of **real estate** and portfolios that invest in real estate may fluctuate due to: losses from casualty or condemnation, changes in local and general economic conditions, supply and demand, interest rates, property tax rates, regulatory limitations on rents, zoning laws, and operating expenses.
